Wind tunnel - Wikipedia A wind tunnel is a tool used in aerodynamic research to study the effects of air moving past solid objects. A wind tunnel consists of a tubular passage with the object under test mounted in the middle. Air is made to move past the object by a powerful fan system or other means. Car Aerodynamics in a Wind Tunnel This is a bonus project for my ME 380 Fluid Dynamics course at UNLV. I do not own the rights to any of the video clips or music. Cars Featured: Pagani Zonda. Full Scale Aerodynamic Wind Tunnel | MIRA Full Scale Aerodynamic Wind Tunnel HORIBA MIRA has the UK's only full scale aerodynamic wind tunnel providing a cost-effective solution for aerodynamic test and development for a wide range of applications from automotive vehicle development, motorsport, aerospace, wind engineering, structures and sport sectors.

Aerodynamic wind tunnel - MECAFLUX when the fluid is air, the study of these phenomena is the aerodynamics. when the fluid is water, the study of these phenomena is the Hydrodynamics . In air the effects of friction are studied experimentally in wind tunnel. Wind Tunnel - NASA Aerodynamicists use wind tunnels to test models of proposed aircraft. In the tunnel, the engineer can carefully control the flow conditions which affect forces on the aircraft. By making careful measurements of the forces on the model, the engineer can predict the forces on the full scale aircraft. Measuring Drag Using Wind Tunnels | HowStuffWorks To measure the aerodynamic effectiveness of a car in real time, engineers have borrowed a tool from the aircraft industry -- the wind tunnel. In essence, a wind tunnel is a massive tube with fans that produce airflow over an object inside.
